1 Negligible/Non-Negligible Functions

For each $n \in \mathbb{N}$, determine whether the following functions are negligible, non-negligible, or neither. Write a proof for your conclusion in each case.

1. (10 points) $f(n) = n^5 \cdot g(n)$, where $g : \mathbb{N} \rightarrow \mathbb{R}$ is a negligible function.
2. (10 points) $f(n) = n^{-1000000000} + 40^{-n}$
3. (10 points) $f(n) = g(n)^{-h(n)}$, where $g, h : \mathbb{N} \rightarrow \mathbb{R}$ are negligible functions.

2 Hybrid Lemma

(10 points) Recall the hybrid lemma discussed in class: let $\{\mathcal{D}_n^1\}, \dots, \{\mathcal{D}_n^m\}$ be distributions such that, for every $1 \leq i \leq m - 1$, the adjacent ensembles $\{\mathcal{D}_n^i\}$ and $\{\mathcal{D}_n^{i+1}\}$ are computationally indistinguishable. If $m = \text{poly}(n)$, then $\{\mathcal{D}_n^1\}$ and $\{\mathcal{D}_n^m\}$ are also computationally indistinguishable.

Explain why $\{\mathcal{D}_n^1\}$ and $\{\mathcal{D}_n^m\}$ are not guaranteed to be computationally indistinguishable if $m = 2^n$.

3 Pseudorandom Generators

Let $G_1 : \{0, 1\}^n \rightarrow \{0, 1\}^{2n}$ and $G_2 : \{0, 1\}^n \rightarrow \{0, 1\}^{2n}$ be two (possibly different) pseudorandom generators (PRGs). Define a function $G : \{0, 1\}^{2n} \rightarrow \{0, 1\}^{4n}$ by

$$G(s_1 \| s_2) = G_1(s_1) \| G_2(s_2).$$

In this problem, we will prove that G is also a pseudorandom generator.

Proof. The function G is clearly deterministic and expands its input from $2n$ bits to $4n$ bits. To show that G is a PRG, it therefore suffices to prove that its output is pseudorandom. Equivalently, we must show that the following distributions are computationally indistinguishable:

- $\{ G(s_1 \| s_2); s_1 \xleftarrow{\$} \{0, 1\}^n, s_2 \xleftarrow{\$} \{0, 1\}^n \}$
- $\{ r \xleftarrow{\$} \{0, 1\}^{4n} \}$

We prove this using a hybrid argument. Consider the hybrids:

- $\mathcal{H}_0 := \{ G(s_1 \| s_2); s_1 \xleftarrow{\$} \{0, 1\}^n, s_2 \xleftarrow{\$} \{0, 1\}^n \}$
- $\mathcal{H}_1 := \{ G_1(s_1) \| r_2; s_1 \xleftarrow{\$} \{0, 1\}^n, r_2 \xleftarrow{\$} \{0, 1\}^{2n} \}$
- $\mathcal{H}_2 := \{ r \xleftarrow{\$} \{0, 1\}^{4n} \}$

By the hybrid lemma, it suffices to prove that

$$\mathcal{H}_0 \approx_c \mathcal{H}_1 \quad \text{and} \quad \mathcal{H}_1 \approx_c \mathcal{H}_2.$$

1. **(10 points) Explain how the pseudorandomness of G_1 and G_2 implies that $\mathcal{H}_0 \approx_c \mathcal{H}_1$ and $\mathcal{H}_1 \approx_c \mathcal{H}_2$.**
2. **(10 points) Prove via a reduction that $\mathcal{H}_0 \approx_c \mathcal{H}_1$.**

Hint: Assume toward contradiction that \mathcal{H}_0 and \mathcal{H}_1 are distinguishable; that is, there exists a non-uniform PPT adversary \mathcal{A} with non-negligible advantage in distinguishing them. Construct a PPT adversary \mathcal{B} that uses \mathcal{A} as a subroutine to break the pseudorandomness of G_1 , thereby deriving a contradiction.

3. **(10 points) Prove via a reduction that $\mathcal{H}_1 \approx_c \mathcal{H}_2$.**
